Hospital-Acquired Complication 13

MALNUTRITION

This hospital-acquired complication (HAC) relates to malnutrition, which is a deficiency of nutrients such as energy, protein, vitamins and minerals, and causes adverse effects on body composition, function or clinical outcome.*

Malnutrition can develop through a deficiency in dietary intake, from complications associated with illnesses causing poor absorption, such as Crohn’s disease and ulcerative colitis; nutrient losses; or as a consequence of increased nutritional requirements of a disease state. The risk of malnutrition becomes more acute for patients as they age, and is associated with a range of adverse outcomes including depression of the immune system, impaired wound healing, muscle wasting, longer length of hospital stay, and higher treatment costs and increased mortality.

Why focus on malnutrition?

Around 5,400 hospital-acquired episodes of malnutrition occur each year in Australian hospitals†

Patients with this HAC require 21.3 extra days in hospital compared to those who don’t

Each episode of care for this HAC could cost the hospital an additional $44,176

Highest rate of this HAC at Principal Referral Hospitals†

Aggregate rate of this HAC at Principal Referral Hospitals

If all hospitals reduced their rate of this HAC to less than 14 per 10,000 hospitalisations, it would prevent at least 1,652 episodes of malnutrition

All facilities should be working to reduce their rates of episodes of malnutrition during hospitalisation.

---

* The specifications for the hospital-acquired complications list providing the codes, inclusions and exclusions required to calculate rates is available on the Commission’s website: www.safetyandquality.gov.au/our-work/indicators/hospital-acquired-complications/

† The data used in this sheet are for hospital-acquired complications recorded during overnight acute episodes of care (excluding same day admissions) in Australian public hospitals in 2015–16. Sourced from: Independent Hospital Pricing Authority (AU). Activity Based Funding Admitted Patient Care 2015–16.

† Hospitals were classified in the Principal Referral Hospitals peer group for these purposes according to the Australian Institute of Health and Welfare’s former definition of major city hospitals with more than 20,000 acute weighted separations and regional hospitals with more than 16,000 acute weighted separations.
**Top tips for prevention and management of malnutrition**

The following provides key points for clinicians to consider to avoid this hospital-acquired complication.

### Conduct risk assessment

- Conduct a comprehensive risk assessment
- Identify risk factors such as: increased age, frailty and impaired mobility, polypharmacy, oral dysphagia, impaired swallowing, constipation, malabsorption conditions and syndromes, Parkinson’s disease, chronic disease, cognitive decline and delirium, dementia, eating dependencies and/or institutionalisation
- Identify patients who are nutritionally at risk, including those who have been admitted to hospital with poor appetites or inadequate food intakes, preceding unexplained or unintentional weight loss, physical difficulty eating and/or drinking, and/or communication difficulties
- Identify patients with high nutritional needs, including those with increased nutritional requirements, those with poor absorptive capacity, some who are malnourished and lactating women.

### For a patient at risk, develop a prevention plan as part of a comprehensive care plan

#### Develop prevention plan

Clinicians, patients and carers develop an individualised, comprehensive prevention plan to prevent malnutrition that identifies:

- Goals of treatment consistent with the patient’s values
- Any specific nursing requirements
- Any allied health interventions required
- Observations or physical signs to monitor and determine frequency of monitoring
- Laboratory results to monitor and determine frequency of monitoring
- If specialist assistance is required.

#### Deliver prevention plan

Where clinically indicated, deliver malnutrition prevention strategies, such as:

- Social measures to ensure provision of meals
- Help with feeding
- Food and fluid intake records
- Modified menus
- Dietetic advice and oral nutrition supplements and/or artificial nutrition support
- Patient and family input where feasible.

### Monitor

- Monitor the effectiveness of any malnutrition prevent strategies, and reassess the patient if malnutrition occurs
- Review and update the care plan if it is not effective or is causing side effects
- Engage in reviewing clinical outcomes, identifying gaps and opportunities for improvement.
