Selected best practices and suggestions for improvement for clinicians

Hospital-Acquired Complication 4

SURGICAL COMPLICATIONS REQUIRING UNPLANNED RETURN TO THEATRE

This hospital-acquired complication (HAC) includes the diagnoses of:
- Post-operative haemorrhage/haematoma requiring transfusion and/or return to theatre
- Surgical wound dehiscence
- Anastomotic leak
- Vascular graft failure
- Other surgical complications requiring unplanned return to theatre.

Many operating theatre visits involve patients who return to theatre unexpectedly following an earlier operation. When patients experience a haemorrhage they may have pain, bruising discomfort, loss of blood pressure, dizziness and collapse. Wound dehiscence (the reopening of wounds) can be highly traumatic to patients and carers. Needing to return unexpectedly to the operating theatre is distressing to patients and carers, and furthermore subjects the patient to repeated anaesthesia risks.

Why focus on surgical complications?

- Around 9,000 hospital-acquired surgical complications occur each year in Australian hospitals
- Patients with this HAC require 19.4 extra days in hospital compared to those who don’t
- Each episode of care for this HAC could cost the hospital an additional $40,236
- Highest rate of this HAC at Principals Referral Hospitals
- Aggregate rate of this HAC at Principals Referral Hospitals
- 25 Per 10,000 hospitalisations
- If all hospitals reduced their rate of this HAC to less than 25 per 10,000 hospitalisations it would prevent at least 1,628 surgical complications requiring return to theatre

All facilities should be working to reduce their rates of unexpected returns to the operating theatre.

* The specifications for the hospital-acquired complications list providing the codes, inclusions and exclusions required to calculate rates is available on the Commission’s website: www.safetyandquality.gov.au/our-work/indicators/hospital-acquired-complications/
# The data used in this sheet are for hospital-acquired complications recorded during overnight acute episodes of care (excluding same day admissions) in Australian public hospitals in 2015–16. Sourced from: Independent Hospital Pricing Authority (AHIPA). Activity Based Funding Admitted Patient Care 2015–16.
† Hospitals were classified in the Principal Referral Hospitals peer group for these purposes according to the Australian Institute of Health and Welfare’s former definition of major city hospitals with more than 20,000 acute weighted separations and regional hospitals with more than 16,000 acute weighted separations.
