4.9 Antipsychotic medicines dispensing 65 years and over

Context

This data item examines dispensing rates of antipsychotic medicines for people aged 65 and over. These data are sourced from the PBS and show the number of prescriptions dispensed per 100,000 people.

In Australia, antipsychotic medicines are primarily used to treat psychotic disorders, including schizophrenia, and the psychotic symptoms of mood disorders. They are used to reduce, or sometimes eliminate, the distressing and disabling symptoms of psychosis, such as delusions and hallucinations.

Antipsychotic medicine is one component of treating mental health conditions, but is rarely considered sufficient on its own. Effective treatment for schizophrenia and related disorders usually includes ongoing clinical support in the community; psychological therapies; education about symptoms and how to deal with them; psychosocial rehabilitation; accommodation, employment and educational support.

In particular, high and inappropriate prescribing of antipsychotics has been documented in older people. Concerns have been raised about prescribing antipsychotic medicines outside guideline recommendations, such as for behavioural disturbances related to dementia or delirium, before secondary causes have been excluded and non-pharmacological measures have been tried.

Magnitude of variation

In 2013–14, there were 919,026 PBS prescriptions dispensed for antipsychotic medicines, representing 27,043 prescriptions per 100,000 people aged 65 years and over (the Australian rate).

The number of PBS prescriptions dispensed for antipsychotic medicines across 324* local areas (SA3s) ranged from 8,043 to 57,130 per 100,000 people aged 65 years and over. The number of prescriptions was 7.1 times higher in the area with the highest rate compared to the area with the lowest rate. The average number of prescriptions dispensed varied across states and territories, from 17,522 per 100,000 people aged 65 years and over in the Northern Territory, to 31,763 in Victoria.

After excluding the highest and lowest results, the antipsychotic medicine prescription rate across the 299 remaining local areas was 2.4 times higher in one local area compared to another.

Dispensing rates were higher in major cities than in regional and remote areas and were lowest in remote communities.

There was some correlation between socioeconomic status and the dispensing rate: the dispensing rate was lower in areas of high socioeconomic status.

Dispensing rates for older adults were higher than for those aged 64 and under, and variations based on socioeconomic factors were less apparent than in younger adults.

Interpretation

Potential reasons for the variation include differences in:

- prescribing practices, training, knowledge and attitudes of clinicians
- the use of antipsychotic medicines outside the guideline recommendations, such as to treat behavioural disturbances in older people
- multiple repeat dispensing, which could influence recorded dispensing rates at the local area level
- the density of aged-care facilities
- private prescriptions, which are not included in this data.

It is also important to note that the dispensing of antipsychotic medicines in remote areas by some Aboriginal Health Services is not captured in the PBS.

To explore this variation, further analysis could focus on:

- individual- and system-level factors that lead to variation in antipsychotic dispensing rates within more specific age groups (for example, 65 years and over, 75 years and over, and 85 years and over, compared to those aged 64 years and under)
- the relationship between dispensing rates and the proportion of older adults living in residential and community settings.

*There are 333 SA3s. For this item, data were suppressed for 9 SA3s. This is because of confidentiality requirements given the small numbers of prescriptions dispensed in these areas.
Figure 95: Number of PBS prescriptions dispensed for antipsychotic medicines per 100,000 people aged 65 years and over, age standardised, by local area, 2013–14

Notes:
- Rates are standardised based on the age structure of the Australian population in 2001.
- State/territory and national rates are based on the total number of prescriptions and people in the geographic area.
- The term local area refers to an ABS standard geographic region known as a Statistical Area Level 3 (SA3).
- PBS prescriptions include all medicines dispensed under the PBS or RPBS, including medicines that do not receive a Commonwealth subsidy. They exclude a large proportion of public hospital drug usage, direct supply to remote Aboriginal Health Services, over-the-counter purchases and private prescriptions. SA3 analysis excludes approximately 34,320 prescriptions from GPO postcodes 2001, 2124, 3001, 4001, 5001, 6843 but these data are included in state/territory and national level analysis.
- For more technical information please refer to the Technical Supplement.
