Osteoarthritis of the Knee

Osteoarthritis is one of the most common chronic joint conditions in Australia. It can cause pain, loss of mobility and reduced quality of life.

Knee osteoarthritis is a major form of the condition and the main reason for knee replacement surgery, with excess weight being a key risk factor.

About 2.1 million Australians are estimated to have osteoarthritis. It is the fourth most common reason people visit GPs.

30% of people aged 65 or older report some joint symptoms. $1.6 billion spent on treating osteoarthritis per year.

Effective management in primary care can reduce the burden of knee osteoarthritis on patients and the healthcare system.

- Provide a comprehensive clinical assessment
- Educate the patient and develop a self-management plan
- Include non-surgical treatments: weight loss, exercise, pain management
- Monitor the patient through planned clinical reviews
- Refer the patient to a surgeon or rheumatologist if conservative management no longer works
